

## Risk Classification of Organisms:

### Pathogenicity classification of (a)pathogenic fungi

Update March 2026

#### COGEM advice CGM/260304-01

##### 1. Dutch Regulations Genetically Modified Organisms

In the Netherlands Decree on Genetically Modified Organisms (GMO Decree) and its accompanying, more detailed, Regulations (GMO Regulations) genetically modified micro-organisms are grouped in four pathogenicity classes, ranging from the lowest pathogenicity Class 1 to the highest Class 4.<sup>1</sup> The pathogenicity classifications are used to determine the containment level for working with GMOs.

A micro-organism of Class 1 should at least comply with one of the following conditions:

- a) the micro-organism does not belong to a species of which representatives are known to be pathogenic for humans, animals or plants,
- b) the micro-organism has a long history of safe use under conditions without specific containment measures,
- c) the micro-organism belongs to a species that includes representatives of class 2, 3 or 4, but the particular strain does not contain genetic material that is responsible for the virulence,
- d) the micro-organism has been shown to be non-virulent through adequate tests.

A micro-organism is grouped in Class 2 when it can cause a disease in humans or animals whereby it is unlikely to spread within the population while an effective prophylaxis, treatment or control strategy exists, as well as an organism that can cause a disease in plants.

A micro-organism is grouped in Class 3 when it can cause a serious disease in humans or animals whereby it is likely to spread within the population while an effective prophylaxis, treatment or control strategy exists.

A micro-organism is grouped in Class 4 when it can cause a very serious disease in humans or animals whereby it is likely to spread within the population while no effective prophylaxis, treatment or control strategy exists.

##### 2. Pathogenicity classification of fungi

The Netherlands Commission on Genetic Modification (COGEM) advises the Dutch government, amongst others, on the classification in risk groups (classes) of organisms according to the risk they pose to human health and the environment. As these classifications are written in Dutch, they are only published on the Dutch section of the COGEM website. To inform other organisations outside the

Netherlands about the classifications of organisms by COGEM, the updated overview of the pathogenicity classifications of fungi has been translated to English. The update includes fungi that have been classified by the COGEM up to 4<sup>th</sup> of March 2026.

Fungi can reproduce both sexually (teleomorph) and asexually (anamorph). A single fungal species can appear morphologically different in the teleomorph and anamorph stage, and was therefore given different names in the past. However, in 2013, the 'International Botanical Congress' decided to replace the dual nomenclature system, and to state fungal species with one name.<sup>2</sup> This system is currently still in transition, and the new nomenclature has not always been applied consistently.

As part of the update of the classification overviews by COGEM, changes in nomenclature and other taxonomic revisions are incorporated as much as possible. During the previous update in 2024, it was determined that the taxonomy of some of the species on the lists was not up to date and contained inconsistencies. Therefore, COGEM commissioned a research project to review and resolve inconsistencies in its lists of pathogenic and non-pathogenic fungal species. The results are presented in the research report '[Update of the taxonomy of the fungal classifications lists of COGEM](#)' (CGM 2025-04).<sup>3</sup> The findings of the research report form the basis for the present update of the COGEM pathogenicity lists.

The classified fungi are listed alphabetically by family in two separate tables. **Table 1** contains the classifications of the apathogenic fungi and **Table 2** contains the classifications of the pathogenic fungi. The current names of the fungal species are provided in the second column of the overview tables. These names also include the author citation and year of publication. The 'Synonyms' column lists valid synonyms, including any teleomorphic and anamorphic names that were previously mentioned separately. Additionally, the 'Invalid synonyms and nomenclature remarks' column contains invalid names or invalid synonyms of fungal species that were included in previous COGEM advice, as well as other remarks regarding the nomenclature of the fungi. Furthermore, the overview tables list the pathogenicity class (PC) and for the pathogenic fungi it is indicated whether they are pathogenic to animals (..<sup>AN</sup>), plants (..<sup>P</sup>) or fungi (..<sup>F</sup>). If it is known by COGEM that the fungus produces toxin (T) and/or can cause an allergic reaction in humans (A), this is indicated in the 'Remarks' column. A hyperlink to the most recent relevant advice regarding each fungus is provided in the last column of the table.
